Nothellasch

Continuation of 11. does NOT place the application in condition for allowance because: The rejection of claim 7-9 and 11-3 under 35 U.S.C. 103 (a) is maintained as Belmares et al. (US 2004/0048531) teach the use of protein at levels from 5-50% ([0023]) dry weight of protein scavenger per dry weight of formaldehyde resin, which encompasses Applicant's limitation in instant claim 1. The applied reference provides no teaching as to what range within said levels is preferred and a skilled artisan would look to the teaching of protein at levels from 5-50% of dry weight of protein scavenger per dry weight of formaldehyde resin. Therefore, absent unexpected results for the claimed range, the rejection is deemed proper. Belmares et al. and Chan et al. (US 6,384,116) are both from the field of glass fiber mats bound by formaldehyde-based resins. The motivation to combine the aforementioned articles for the maintained rejection is that the binder composition of Chan et al. would yield the article of Belmares et al. with improved tensile strength (Chan et al. Abstract). The example provided by Trocino (WO 01/59026) with higher protein content than that instantly claimed serves as only one embodiment of the invention of Trocino and does not serve as the only embodiment available under the applied teaching. Belmares et al. and Trocino may have different reasons for the use of protein in their adhesive compositions, but they are both from the same field of endeavor (i.e. soy protein binders for use in fiberboard panels.
